Deep Oaks TREE-LEVEL Data Sheet -- Quail Ridge 2023 -- Bogar Lab

center of core dist from trunk 47 cm

Date	Sampler initials	Dead (burned)?	Tree	Coordinates (lat/lon)	Saved in Avenza as...	Site photo taken with GPS enabled? (Correct = Y)	Trees within 10m: identity	Trees within 10m: distance (m)	Trees within 10m: Bearing (degrees) from focal tree	Notes
230522 22 May 2023,	LB EW	N,	T04	38.4980921, -122.150914	Tree 04	Y	Manzanita? 6.80m	6.80m	0°	Live and burned, west side of tree

Deep Oaks Data Sheet -- Quail Ridge 2023 -- Bogar Lab Date: 05/22/23 Samplers: LB's, EW

~12PM

Dead (burned)?	Tree	Depth (cm)	Wet mass of core INCLUDING BAG (g) (lost some clumps, don't use for bulk density)	Soil mass (extraction tube) (2.0g +/- 0.1g)	Soil mass in pH tube (g) (5.0g +/- 1.0g)	Soil mass saved in whirl-top bag (40-50g, EXCLUDING bag)	Notes — Actual deepest core position approx. 90-96 cm
N	T04	~90-100	866.4g	1.1	5.0	45.9	Burned but alive core not standard, from auger
"	"	0-7.5	659.6	2.0	5.0	56.2	Many thin grass roots but only 2 >1mm thick; sand)
"	"	7.5-15	736.8	2.0	5.0	49.5	Lots of potential oak roots
"	"	15-22.5	859.6	1.9	4.5	50.4	↑ same
"	"	22.5-30	934.8g	1.9	4.9	49.5	Lost about 50% of sample after sieving
"	"	30-37.5	735.9	2.1	4.3	48.9	could not hammer fully flush w/ surface. Either subtract 1cm from height (6.5cm
"	"						total) or don't use for bulk density. Also had to shift core position,
							bulk density is suspect.
~4:45PM "	"	37.5-~~40~~ 42	473.2	2.0g	4.9g	49.3g	Could not hammer fully flush. Left 3cm head space all around
							(so core height = 4.5cm for bulk density)
	Frozen samples stored -70°C @ 6PM						HIT ROOT, core also ragged on bottom, don't use for
	Cooler had smaller layer of maybe 50% dry ice pebbles						bulk density.
	& 50% water ice at the bottom; samples still						True core depth is somewhere between 40-45cm
	cold, prob. frozen but not sure.						depending on what part of the hill is "surface"
	Take more dry ice from scientific store next time.
